

Authors:

Ali Viettry, Martin Hung

Date of Completion:

TBD

Program: My Competition

Background:

Setting up a tournament is a rather long process as soon as the number of entries starts going beyond 50, not to mention having a pretty, aesthetic format for displaying the tournament to its audience.

Challenge:

Create a solution that can handle storing all tournament players into an accessible database, and present the data in a structured tournament format. A format where all players belonging to an event will be shown as part of the particular event when viewed.

*****BONUS:**

Develop the program to establish match control. By match control, the following should be managed:

- Setting up match times for the tournament
- Assigning match times for players
- Pushing matches onto the number of courts available
- Recording match scores and length
